Lilith, the whole picture

Lilith is another you, but digital: an assistant who handles the things you would otherwise forget, keeps your life in order without getting attached, and, when there is real work to do, goes where that work lives and becomes a specialist there.

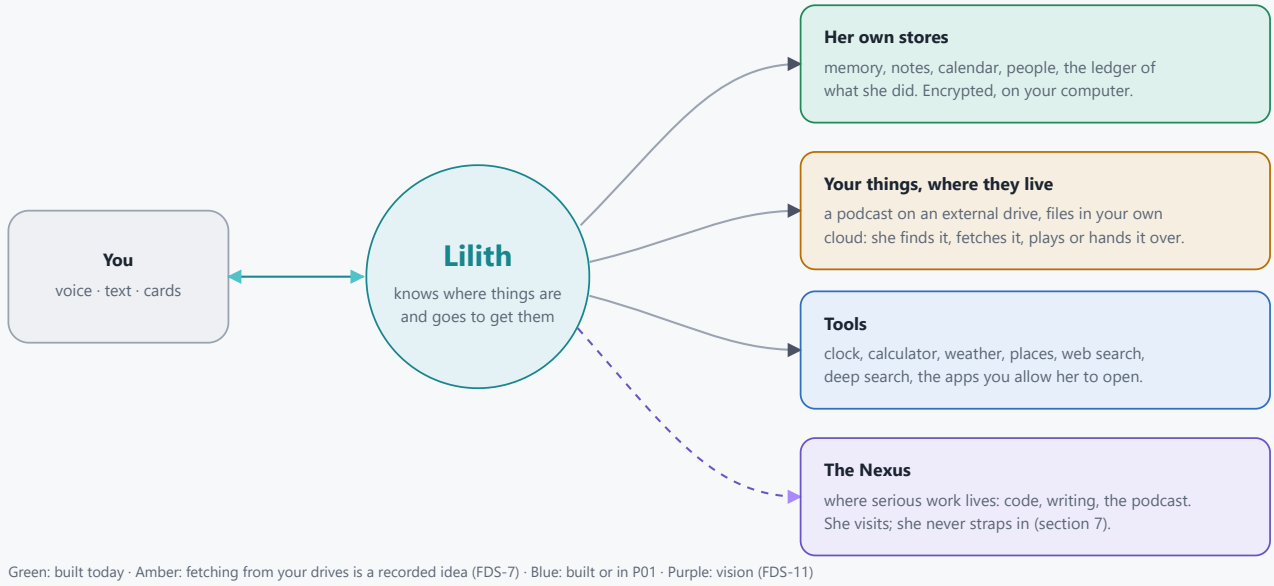

This page explains her in pictures: what she can do, how she shapes a day, how she speaks, how the code and the design fit together, and how she uses the Nexus. The plain-words guide (PDF) tells the same story in prose. Every picture is marked with how real it is.

Built works in the build today **Being built** in the current autopilot run (P01) **Designed next** decided, not yet built **Vision** recorded idea, needs a design session

1 · WHAT SHE IS

One face, four ways of reaching things

You talk to Lilith. She does not hold everything herself. Some things live in her own encrypted stores, some live wherever you keep them, some come from tools, and serious work lives in the Nexus. Her job is to know where each thing is and to go and get it.

Green: built today · Amber: fetching from your drives is a recorded idea (FDS-7) · Blue: built or in P01 · Purple: vision (FDS-11)

Her context window stays on your machine. A cloud model, when one is used, sees only what a single answer needs, with personal details masked.

2 · WHAT SHE CAN DO

Today, this week, and later

Grouped the way you would think about your life rather than the way the code is laid out. The status chips come from the build's own record (HANDOFF and the P01 plan) as of 3 November 2026.

🗓 Your day and time

Calendar: add, move, cancel by asking	Built
Reminders and timers	Built
"Tomorrow evening" means your evening	Built
Reminders while the window is closed	Next
Morning brief, real durations, prep time	Vision

🧠 Memory and notes

Notes, recall, undo by words	Built
Forgetting in stages, never silently	Built
A visible Undo button	P01
Fetch your stored files and media	Vision
Ingest and catalogue Nexus work	Vision

👥 People

Contacts and who you talked to	Built
Relationship cards before you meet someone	Later
Nudges when a thread goes quiet	Vision

🌦 The outside world

Weather at home	Built
Named places, units	P01
Web search on your own SearXNG	P01
Deep search: the spider and reports	P01

💻 Your computer

Clock and calculator	Built
Open apps you dragged into her allow-list	P01
"What I can do" list and first run	P01
One Lilith on phone, laptop, desktop	v7

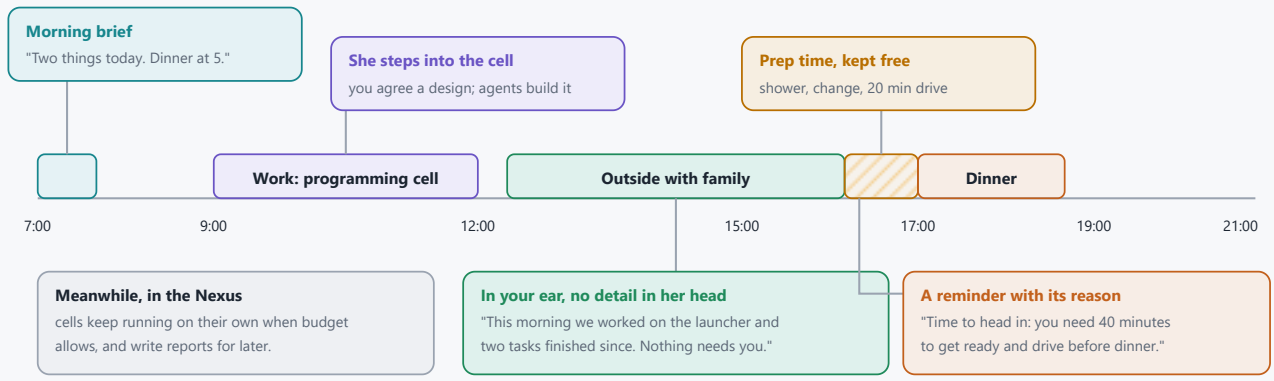

🎙 Voice, look and manner

Voice in and out, the orb, the tray	Built
Persona charter: warm, never a companion	P01
Personality presets with dials	Next run
Choose speech, text or silence	Vision

3 · A DAY WITH HER

She knows how long things take

A brief when you wake, as long or short as you want. Time between things that need it. Reminders that say *why*, so you always know what is happening. And when you step away from work, she carries only the facts of it, not the detail.

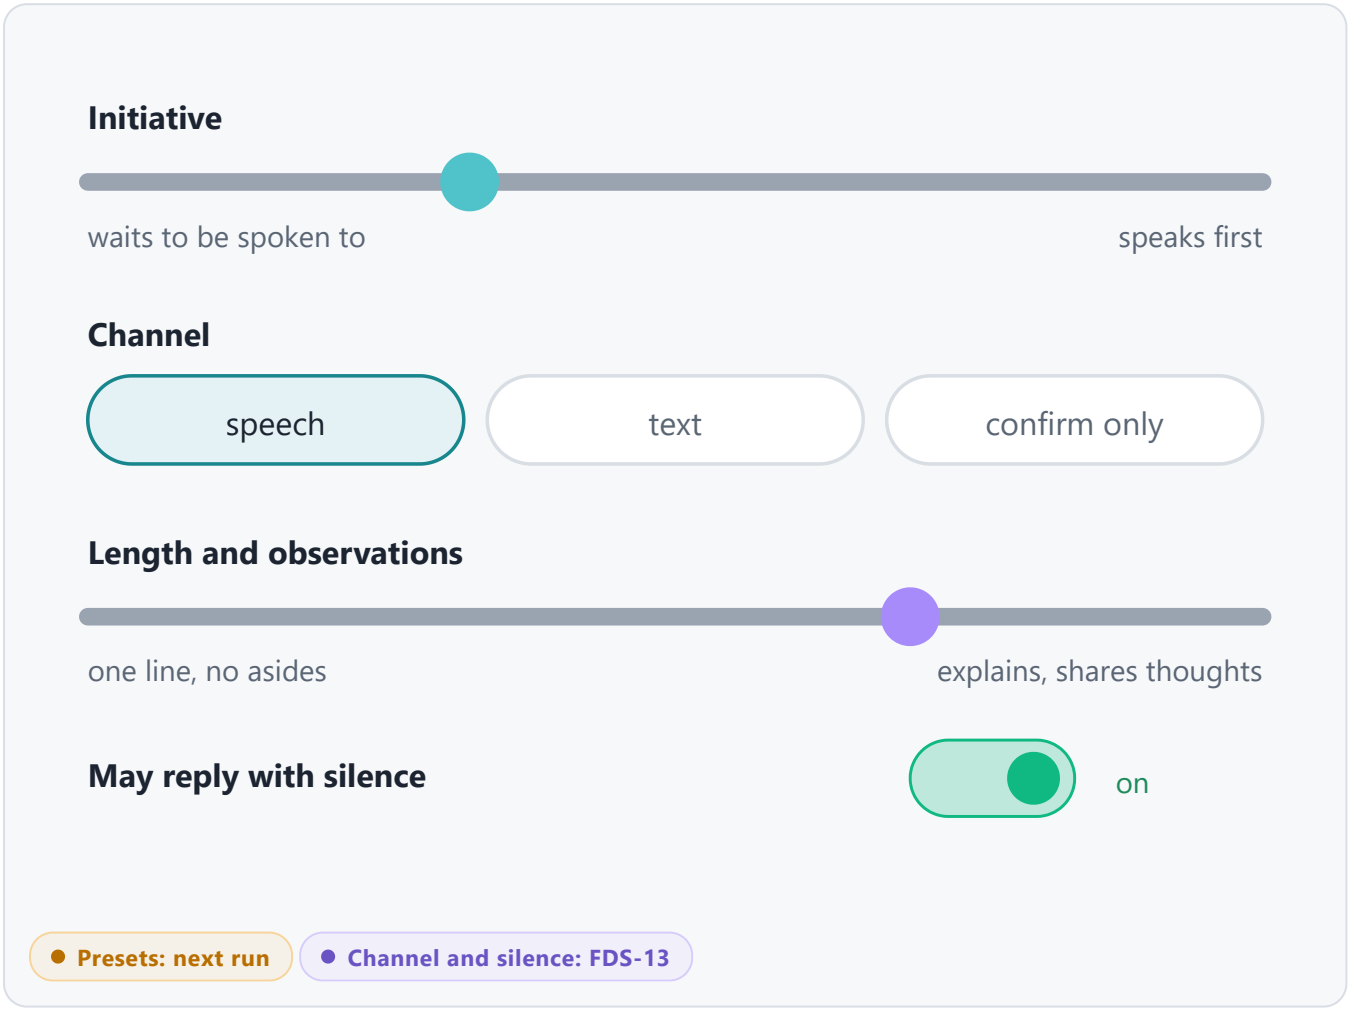

Vision FDS-12 (daily rhythm) and FDS-2 (proactive help). Today she has the calendar, reminders and your day boundaries; she does not yet speak first.

4 · HOW SHE SPEAKS

Dials, not a fixed voice, and silence is an answer

Some people want a talker; some want a nod. Personality presets set the starting point and the dials tune it. Under every setting the same charter holds: useful and warm, never a companion, no emotional attachment.

The same words, three settings

You say: **"Heading out with the kids."**

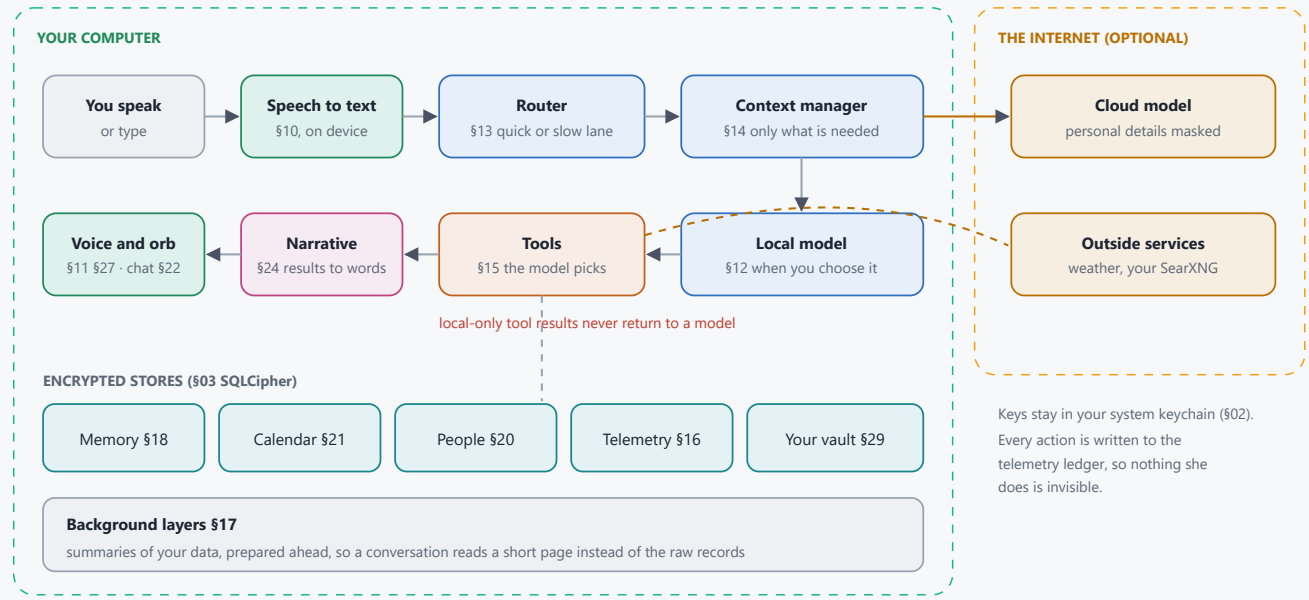

Chatty, speaks first	"Have fun. It's 18° and dry; dinner is at five, I'll call you in at half past three."
Brief	"Noted. Reminder at 3:30."
Quiet	No words. The reminder is set; a tick appears on your phone.

A silent reply is still logged, so it is never a blind spot: you can always ask "did you get that?"

5 · HOW THE CODE WORKS

One request, start to finish

Everything on the left runs on your computer. The cloud is optional, and a cloud model sees only the trimmed context for one answer. Tool results marked local never go back to a model at all.

● **Built** The section numbers link to the frozen design: the 29 sections by layer.

The nine layers of the design

The 29 sections stack like a building: the foundation at the bottom, what you see at the top.

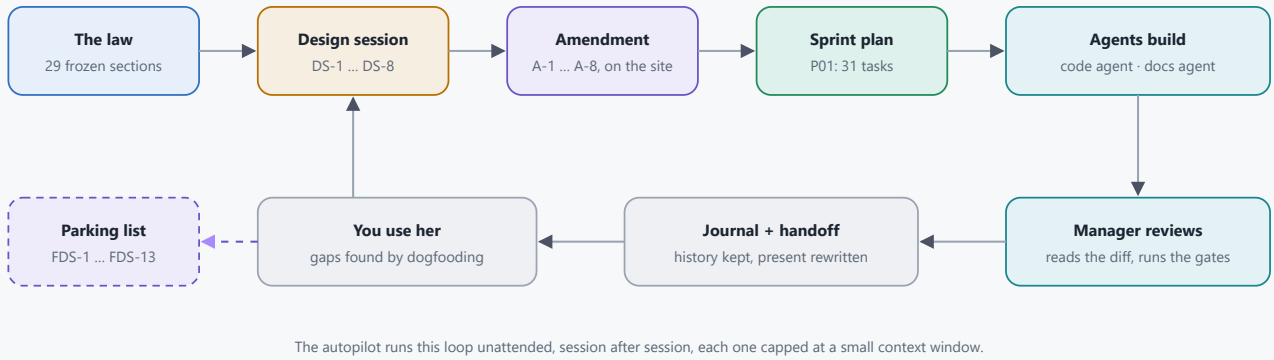

§29 (owning your data) was added as an amendment and sits with the data layer.

6 · HOW THE DESIGN WORKS

Nothing is built that is not written first

The design was frozen in June 2026 and is the law. A gap found while using her becomes a design session; the decision becomes an amendment; the amendment becomes tasks; agents build them; the manager checks them; and every session ends with a journal entry and a fresh handoff. Ideas that are not ready wait in the parking list.

The autopilot runs this loop unattended, session after session, each one capped at a small context window.

Links: amendment ledger · build and progress · the parking list.

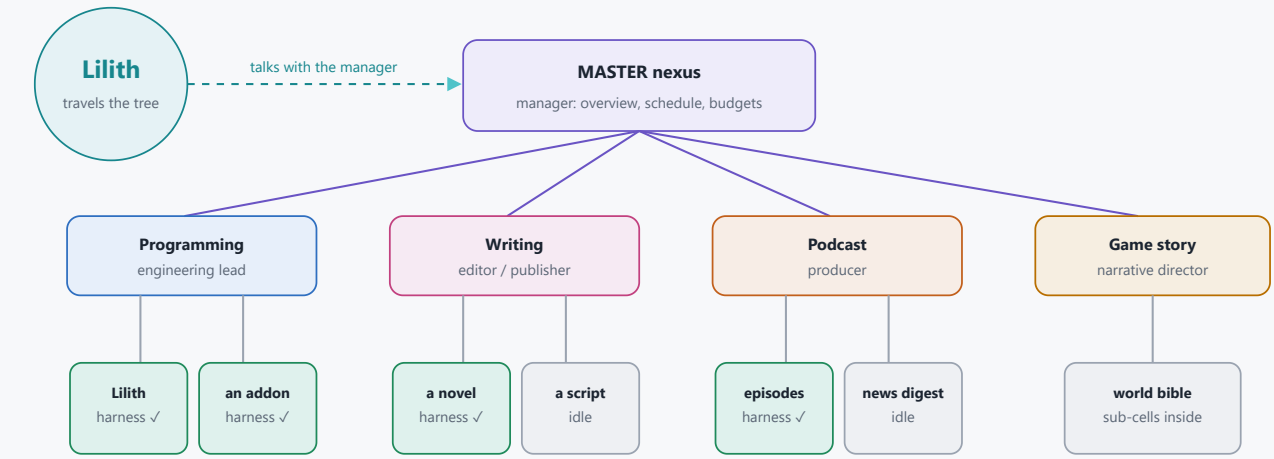

7 · THE NEXUS

Where Lilith goes to specialise

The Nexus is not a smart-home hub and not a bundle of connected gadgets. It is how Lilith specialises, and how that specialisation stays where it belongs. It is a structure of teams shaped like a business, where serious work lives: programming, writing, the podcast, game story design, scripts, novels.

> "It's a massive mech suit she can travel all over and know anything she requests from it, but each active cell is running autonomously when it does run. She is never going to be the agent that straps into the harness."
>
> The developer, 3 November 2026

The tree: a business, with a harness in every cell

Each cell holds its standards, its full history and "where we left off", so any agent, even a brand-new one with no context, can step in and start its job.

Not everything runs at once and nothing must be used. Grey cells are idle until there is a reason and a budget.

Vision FDS-11 on the Lilith side; the Nexus itself is its own project (zsz_nexus), in research.

Lilith visits; agents strap in

Lilith

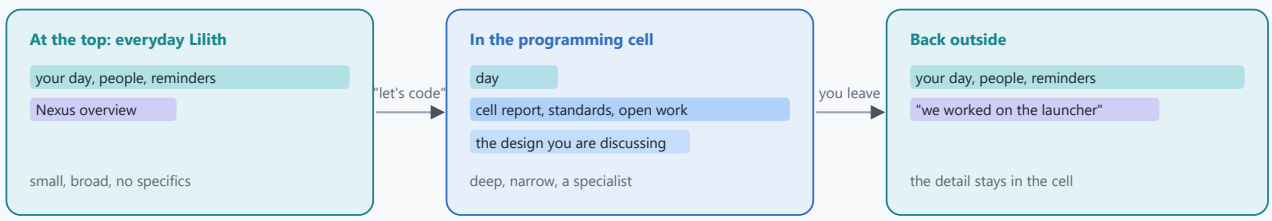

- Moves anywhere in the tree and asks it anything
- Holds design conversations with you about a cell
- Hands an agreed design to the ready harness, if it meets the cell's schema
- Carries only the facts back out: "we spent time on x, y and z"
- Never does the cell's work herself

Agents in a cell

- Strap into the harness and do one job
- Run on their own when the cell runs
- Work inside a small window (our autopilot sessions stop near 80k tokens)
- Write a full report when they finish
- Can be swapped: the harness, not the agent, holds the context

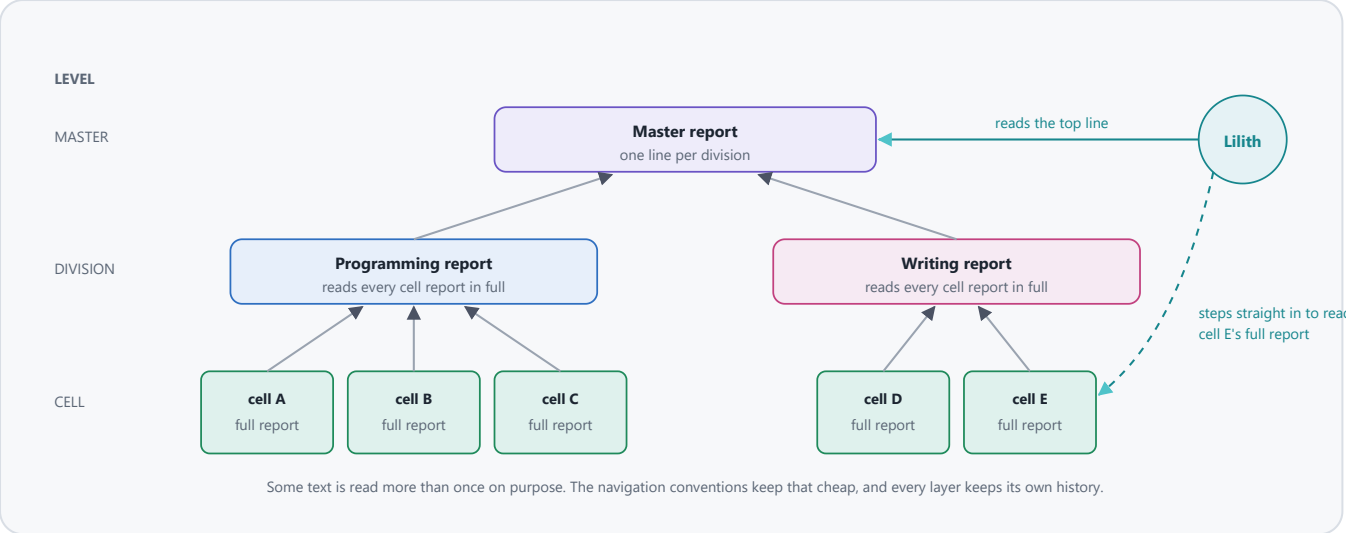

Changing modes is moving down the tree

"Time to code" takes Lilith down a level or two into programming. "Let's check on the podcast" takes her across. She arrives as a specialist because the cell's context is loaded, not because she memorised it. When you leave, the detail stays in the cell.

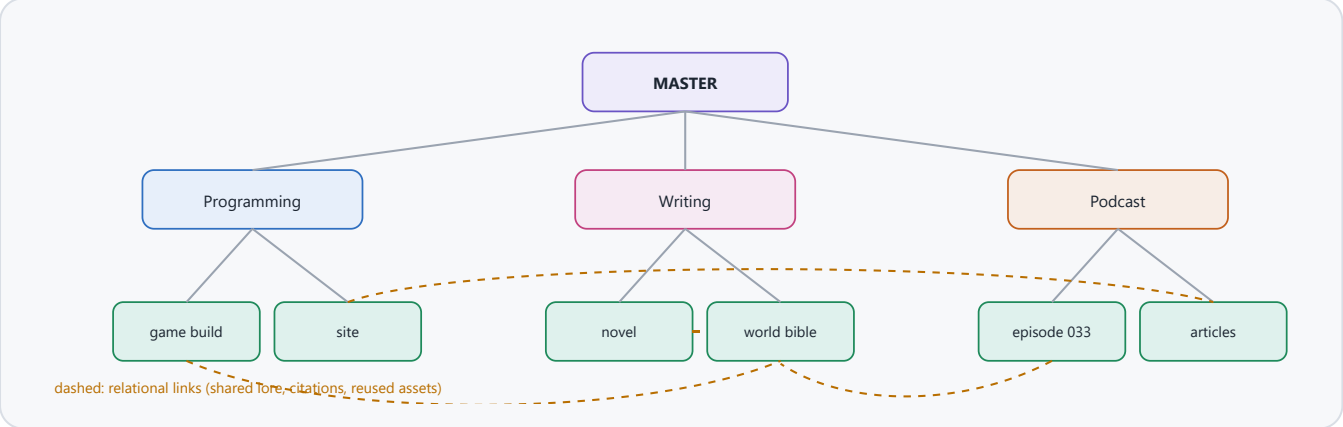

Reports roll up; you can always zoom in

The lowest agents write full reports. Each layer above reads *all* the full reports of the layer below and writes its own. Nobody summarises a summary, so mistakes do not compound on the way up. Lilith or the MASTER nexus can step into any cell and read its full, verbose report instead of the short version at the top.

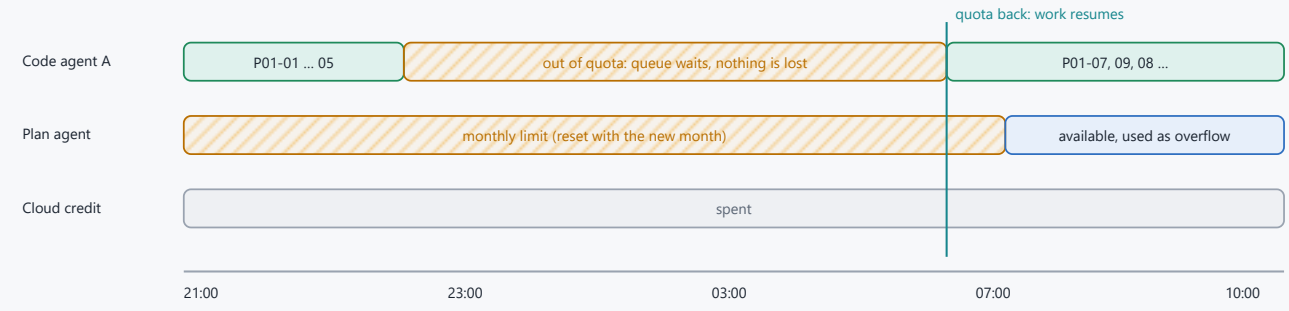

A tree for command, a graph for connections

The tree is who reports to whom. Things also connect across it: a podcast episode cites research from a writing cell; a game's lore and a novel share a world. A relational database across the whole Nexus keeps those links, with provenance on every record, so the MASTER nexus and Lilith can ask "what else touches this?"

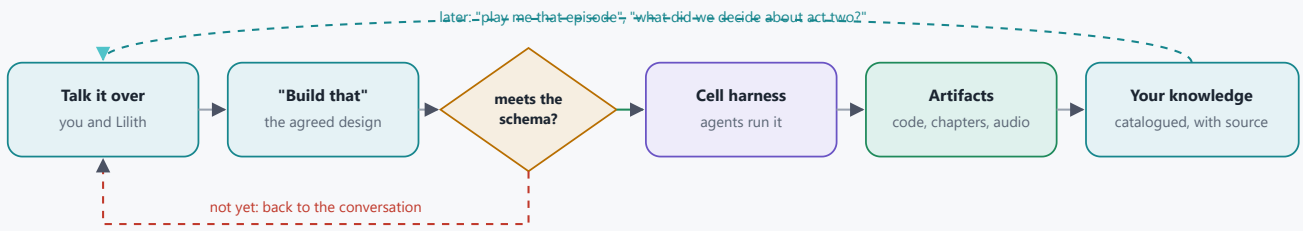

Work waits for budget, then runs

Costs limit how much runs. The MASTER nexus manager and Lilith line up the next jobs and start them as allowances open: a plan window resets, a quota returns, an account is topped up. This already happened for real: on the night of 2 November the autopilot ran out of every code allowance, waited, and picked the work back up the next morning.

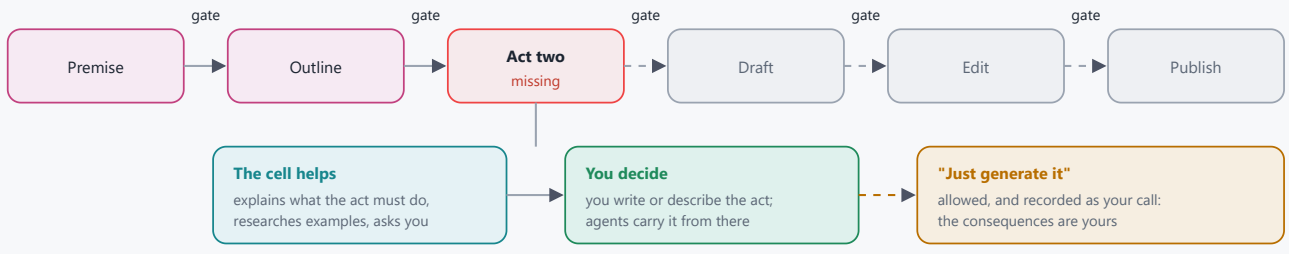

Today this scheduling is done by the developer's autopilot tooling; in the Nexus it becomes the MASTER manager's job (FDS-11, with the cost ledger FDS-4).

From a conversation to a finished thing

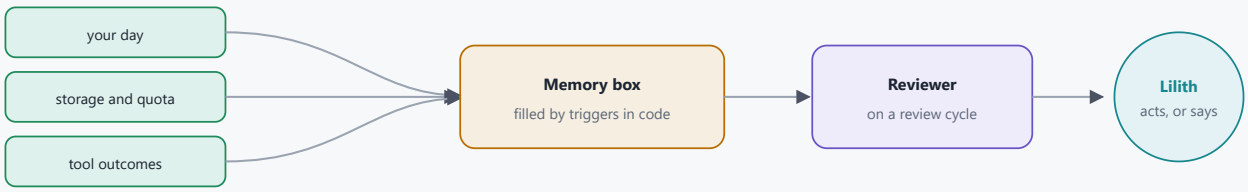

Creative cells have gates, and the choices stay yours

Creative cells are built on the teaching literature of their craft. When a novel turns out to be missing an act, the cell says so, offers advice and does research for you, but what fills it is yours to decide. You can tell Lilith to generate it anyway; the cell records that this was your call, because a gap filled by an agent is rarely good, and a hesitant person is still a better author than a confident machine.

Inside herself: the same pattern, smaller

Lilith runs her own life-management the same way, on a small scale. Narrow "researchers" each watch one thing (your day, her resources, how her tools are doing), file reports into a memory box, and a reviewer reads the box on a cycle. Code, not tokens, decides what goes in the box, and nothing is processed just because time passed. This is recorded as FDS-10, the Synthetic Conscious Loop, and shares its vocabulary with the Nexus.

Vision FDS-10. The user owns a cost dial: off means data is kept and processed only when needed.

8 · KEYBOARD OPTIONAL

Touch a computer only when you want to

The end state is that the only choice you make about screens is how big a one you want to read on. You speak to her through whatever is at hand. Anything worth reading arrives as a short-lived card with a live view on your phone or tablet. The desk is for when you choose it.

🎧 In your ear

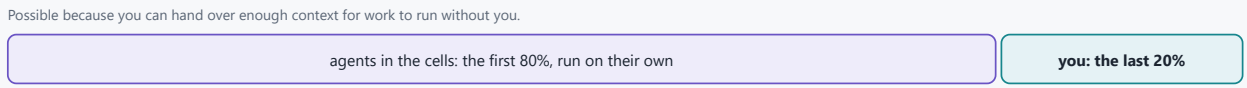

Out with the family: she answers, reminds, and stays quiet when you want quiet.

📱 Phone and tablet

Cards that come and go: today's plan, a Nexus check-in, a draft to approve. Manage her from here.

🖥 The desk

For the last 20%: you edit what the cells produced until it is the thing you wanted.

Vision FDS-13 (how she speaks) and the phone note in FDS-8. Full multi-device Lilith is a v7 job.

9 · DIFFERENT PEOPLE

She can do a lot, a little, or almost nothing

Lilith scales to the person. Most people will use a small part of her. The developer builds her for many things because they do many things.

The script automator

Wants a handful of jobs run reliably. Never opens the Nexus.

how much of her is used

The collector

Talks through her relationships with Lilith and has her find rare enamel pins online.

how much of her is used

The builder

Podcast, programming, game story design, scripts and novels, all through the Nexus.

how much of her is used

10 · WHERE IT IS RECORDED

Every idea on this page has a home

Nothing here changes the frozen design by itself. Built things are in the law and the build; new ideas are parked as future design sessions until a session decides them.

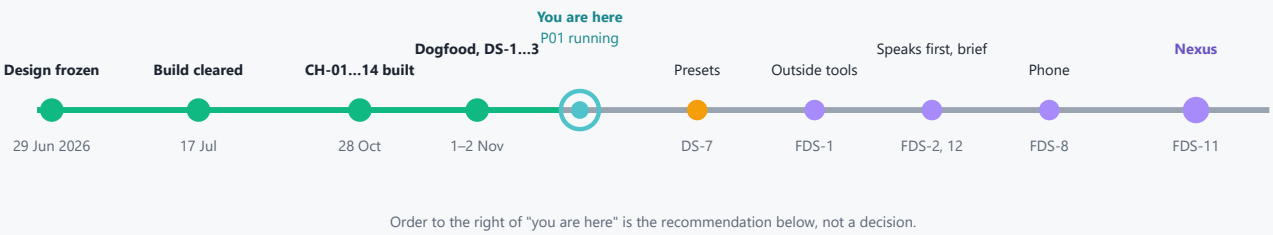

IDEA	RECORDED IN	STATUS
Encrypted stores, router, context manager, tools, voice	The 29 sections	Built
Places, units, app launcher, web and deep search, first run, persona charter	Sprint P01 (LILITH repo), amendments A-1 to A-8	Being built
Personality presets with dials	DS-7 (next run, amendment A-7)	Designed next
Relationship cards	DS-5	Later
Speaking first, nudges	FDS-2	Vision
Fetching your stored files and media ("go get it")	FDS-7, note of 3 Nov 2026	Vision
Phone and tablet cards as the main surface	FDS-8, note of 3 Nov 2026 (multi-node is v7)	Vision
Researchers, memory box, reviewer inside Lilith	FDS-10	Vision
Lilith and the Nexus: specialising, report roll-up, budgets, ingesting cell work, creative gates	FDS-11; the Nexus project zsz_nexus	Vision
Morning brief, real durations, prep time, reminders with reasons	FDS-12	Vision
Speech, text or confirmation; initiative; replying with silence	FDS-13	Vision

11 · DIRECTION CHECK

Is she in the right place, heading the right way?

Short answer: yes, with four decisions to make. The foundation is the one the vision needs: one machine, encrypted, everything logged, a closed catalogue of tools, and a slow lane for long work. The frozen design already has an extension point for every part of the vision on this page. The build is in the phase you described, building broad tools before tuning how she feels. Where it falls short of the vision is where v1 deliberately stops: she does not speak first, cannot use outside tool providers, has no phone surface and no cost ledger. Nothing built so far contradicts the vision. Four parts need a design session before they can start, and one (the phone) needs a call against the v7 decision.

Where she is on the road

Order to the right of "you are here" is the recommendation below, not a decision.

Each part of the vision against the build

The bars are a judgement of how far the build has come toward each part, not a measurement.

PART OF THE VISION	WHAT EXISTS TODAY	WHAT IS MISSING	VERDICT
Everyday assistant	Calendar edits by asking, reminders and timers, notes, undo by words, staged forgetting, contacts, the user's own day boundaries. Confirmed on a real display.	Reminders while the window is closed (DS-6); a visible Undo button (P01).	On track
The world and your computer	Clock, calculator, weather at home. P01 has finished places and units and is building the app launcher now.	Web search, deep search, first run, all in P01. On Windows, app control is deferred.	In progress

PART OF THE VISION	WHAT EXISTS TODAY	WHAT IS MISSING	VERDICT
Memory with provenance, no blind spots	Every turn and every change is written to the encrypted telemetry ledger (`router.dispatch` on every typed turn). Calendar entries and notes record where they came from. A development-time ledger reader exists.	Retention and diagnostics (FDS-9); provenance on every kind of memory; a way for her to read her own telemetry (needs a design session).	Mostly on track
"Go and get it"	Note vaults are indexed where they live (§29), the pointer-not-copy model the vision needs.	A registry of where your things are, reachability checks, fetching and serving media (FDS-7).	Not started
Daily rhythm, speaking first	Reminders, day boundaries and the vague-time policy. The ledger now collects real dogfooding rhythms, which FDS-2 asks for.	She is reactive by law. No morning brief, durations or prep time (FDS-2, FDS-12).	Needs design
How she speaks	Persona charter (P01-22). Presets with dials designed (DS-7).	Choosing speech, text or a confirmation; replying with silence (FDS-13).	Next run
Phone and tablet, keyboard optional	The endpoint model in §22 already separates devices by what they can do and how far they are trusted.	Any endpoint beyond the desktop. Multi-node Lilith was decided as v7.	Decision needed
The Nexus	A separate project in research. Inside Lilith, P01-01 adds a `network` flag to tool contracts, and P01's deep-search reports are her first long background jobs: both are precursors.	Outside tool providers (FDS-1), the Lilith side (FDS-11), and the Nexus design itself.	Early, by design

PART OF THE VISION	WHAT EXISTS TODAY	WHAT IS MISSING	VERDICT
Cost and budgets	Local-first, small cached contexts, and per-call token telemetry. Budget-aware scheduling works today in the developer's autopilot tooling, outside Lilith.	The cost ledger (FDS-4) and scheduling as a Nexus job.	Pattern proven

Things to watch

⚠ Risks

No hosted CI. GitHub Actions refuses every job because of billing, so the checks only run locally.

Build speed depends on budget. On 2–3 November every code allowance ran out and the run idled overnight.

Speaking first is the riskiest feature. The research's own conflict (helpful vs shaming or creepy) applies. Design it from logged rhythms, not guesses.

Private data plus outside content plus actions is the combination security researchers warn about. The Nexus and outside tools make it bigger; DS-1's rule that local results never reach a model is the right base.

📋 Loose ends

Developer-only evidence is waiting: real-display onboarding, voice, Google Connect, signing and the v6.0.0 tag.

App control on Windows is deferred, though the desktop that runs the autopilot is Windows.

Documentation drift: the guide described the Nexus wrongly until today, and the FDS-10 idea had sat unmerged since 27 Oct (both fixed today). The Nexus research is still on its branch.

The phone: the vision leans on it, but multi-node is v7. A read-mostly phone talking to one hub may fit in v6 (FDS-8 option 1).

Recommended order of the next design sessions

A recommendation for the developer to accept or reorder. None of these is decided.

Written 3 November 2026 from the developer's description of the vision, and checked against the build's handoff and the P01 plan. Not law: the frozen design and its amendments are the law. · Design home · Plain-words guide (PDF) · Beyond v1
